

Does the data support my hypothesis?

A self-serve tool that shows whether a local intervention actually moved the data — and, alongside the district dashboards, whether the problem simply moved nearby.

WHY IT EXISTS

City staff constantly change the environment in response to resident complaints — new lighting, trimmed sightlines, a staffing shift, an enforcement push. But confirming whether a change *worked* usually means waiting for a report or making a judgment call. This tool gives any pod member a fast, neutral, same-day read from live public data — no analyst required.

SEE IT IN ACTION

A plainclothes-officer deployment in the Central Police District, logged May 11, 2026, expected to reduce drug-related activity. **Community-reported drug calls within 200 m fell about a quarter (–26%)** after the intervention — from a rate of ≈ 22 to ≈ 16 calls per 30 days. The tool measures *residents calling about drug activity*, not officer-initiated stops, so the drop reflects a real change in what the neighborhood was experiencing.

The tool reports a per-day rate, so the uneven before/after window (191 days vs. 37) can't inflate the result.

HOW IT WORKS

1. **Describe the intervention** — what you did, and drop a pin where you did it.
2. **Pick what you expected to change** — one of 14 vetted signals (drug activity, encampments, dumping, graffiti, noise, and more), each tied to a specific open-data source.
3. **Read the result** — the tool queries live SF OpenData within a radius of your pin and shows a plain-language before/after verdict, a trend chart, stat cards, and a map of every underlying report — plus the exact query behind every number.

BUILT RESPONSIBLY

- **Live public data.** Every signal comes from data.sfgov.org; the tool runs the query in your browser.
- **Fully reproducible.** Each result shows the dataset and the exact runnable query, so anyone can verify the number.
- **Honest by design.** The tool reports rates (not raw counts), flags short or unreliable windows.

PART OF A LARGER SYSTEM

This tool answers a **local** question: *did my intervention move the data right here?* The district dashboards answer the **wider** one: *did that activity just move nearby?* Their hot/cold maps — “Hotspots: what moved” and “what changed” — reveal where a behavior faded and where it reappeared across a whole district over time.

Together they guard against the classic trap: a local win that is really just displacement. Zoom in to confirm the effect; zoom out to check it didn't push the problem onto the next block.

WHO IT'S FOR & HOW TO SEE IT

Built for Neighborhood Safety pod leaders and intervention owners; useful to anyone tracking whether local action is working.
